

testing::Test

testing::WithParamInterface< T >

testing::TestWithParam< int >

NamingTest

```
classDiagram
    class Test["testing::Test"]
    class WithParamInterface["testing::WithParamInterface< T >"]
    class TestWithParam["testing::TestWithParam< int >"]
    class NamingTest
    Test <|-- TestWithParam
    WithParamInterface <|-- TestWithParam
    NamingTest --|> TestWithParam
```

The diagram illustrates the relationships between four classes in a testing framework. At the top, there are two base classes: `testing::Test` on the left and `testing::WithParamInterface< T >` on the right. Below these, in the center, is the class `testing::TestWithParam< int >`. At the bottom is the class `NamingTest`. Arrows indicate inheritance: a horizontal line with two upward-pointing arrows connects `testing::Test` and `testing::WithParamInterface< T >` to `testing::TestWithParam< int >`. A single vertical arrow points from `NamingTest` up to `testing::TestWithParam< int >`.
